About *Fastrak*

Fastrak from MCIH is a microcontroller based PID controller with Auto tuning algorithm embedded in the software of the instrument. The instrument has powerful hardware capabilities like universal inputs, Transmitter powering, Terminal embedded cold junction sensor and front keypad for user configuration. The controller has various control output options to suit any type of end control element. The powerful embedded software of the controller provides complete access to the configuration of the various parameters of the controller from front panel. This offers the best operational reliability by eliminating switch settings, jumper selection and trimpot adjustments.

Fastrak is offered in four different models to give cost effective and optimised solutions covering every control requirement.

Fastrak - CN, *Fastrak* - DN are PID controllers with Time proportional contact output mainly intended for temperature control applications with T/C or RTD as input. The model does not support an analog output.

Fastrak - CA, *Fastrak* - DA are with analog output and contact output options configurable through software (refer to ordering code).

Tx-powering, Square root option and linearisation of T/C & RTD inputs are features common to all modules.
